The ISBNs of this book are 978-1-788832-43-1 and 978-1-788832-42-4. The book title was originally published as The Human Condition. Get this ebook from Amazon's Kindle Store. Books that are hard to find on Kindle can be found on Nook. You can check out my web site at: How to get the user id from the server in android I am storing some data in the DB. This data should be checked in the server. For this purpose I am getting the ID from the server. I am able to get the ID from the android. But I want the same ID which I have got from the server. How can I get that from the server. How can I get the user id from the server. A: On the server, you store the user id, or you set a session. If you have a session, the user id is associated with that session. If you don't have a session, you can authenticate the user by sending the username and password. So in your case, you should be able to get the id from the server. If you are using sessions, here is how you should implement it. Q: Process a string as if its a pointer to a struct I want to be able to process a string as if it is a pointer to a struct, and then create a list containing all the names that were found. I have defined a struct like so typedef struct Customer { char* name; char* address; int age; int id; char* contactNumber; float balance; } I'm having trouble getting the program to work. I have tried the following methods: int main() { char name[5]; char address[5]; char contactNumber[7]; char age_str[3]; char id_str[2]; float balance_str; int i, id; cout > 82157476af
